

## CSCI 2500 ASSIGNMENT 4 FALL 2009 DUE 10/30

Redo Assignment 2 using arrays, For ... Next loops, the form load event, and Sub procedures.

Make all variables class-level except for the StreamReader object, the format strings, and the index of the For loops. You will have 7 arrays and a grand total as class-level variables.

Read the file contents and put them into three arrays in a form load event procedure.

Your button-click Sub procedure will contain two statements: a call to a Sub procedure named DoComputations( ) which does all of the computations a call to a Sub procedure named DisplayResults( ) which displays the results in a list box.
